2FA and Signing with GitHub

By Christian "chrissx" Häußler

Previously on chrissxYT/i3buntu

- ghk/ghp
- no signing

ghk & ghp

```
echo "key" | openssl aes-256-cbc -a -in - -out ~/.ghk.enc
```

ghk

```
openssl aes-256-cbc -d -a -in ~/.ghk.enc -out -
```

ghp

```
ghk
git push
```

problems

- copy-pasting is annoying
- the key is visible on your screen -> bad idea at conferences, etc
- you have to re-enter your passphrase every time

why i used them

- i cant pipe creds into git push
- you have to code a cred helper, wtf is that?!
